***Allowable Subject Matter***

1. Claims 1-3, 6-16 are allowed.

Independent claim 1 is directed towards an optical observation device and recites "...a third memory (80) which is in data communication (81, 82) both with the first memory (71) and also with the second memory (73) and in signal communication (83) with the control device (75), wherein the at least a portion of content of the first memory is transferred to the third memory as a reaction to the generated trigger signal while the second memory is being replaced..." which is a feature that is not anticipated nor obvious over the art of record. Dependent claims 2-3, 6-9 are allowed for the same reasons concerning the independent claims. Independent claims 10-11 are directed towards an operation microscope and includes "...the video device (7) includes a first memory (71) for temporary storage of the image signal, a second memory (73) in data communication (77) with the first memory (71), and a control device (75) in control communication (76B, 76C) with both memories (71, 73) for controlling the storage procedure and data transfer from the first to the second memory, wherein the control device is adapted for controlling the storage procedure for the first memory in such a way that the image signal is stored over a predetermined period of time and an oldest image signal is continuously overwritten by a fresh image signal, and that transfer of at least a portion of content of the first memory (71) to the second memory (73) takes place as a reaction to a trigger signal generated in response to an observable situation of the surgical operation, wherein the optical system and video device are disposed in an optical, longitudinal axis..." which is a feature that is not anticipated nor obvious over the art of record. Independent claim 12 recites a method of observation of an object using an optical observation apparatus during a surgical operation,

Art Unit: 2621

comprising "... temporarily storing the image signal in a first memory and controlling the storage procedure for the first memory in such a way that the image signal is stored over a predetermined period of time and an oldest image signal is continuously overwritten by a fresh image signal; generating a trigger signal in response to an observable situation of the surgical operation; and transferring at least a portion of content of the first memory to the second memory as a reaction to the generated trigger signal, wherein the portion of content of the first memory includes image signals representative of the observable situation..." which are features that are not anticipated nor obvious over the art of record. Dependent claims 13-15 are allowed for the reasons concerning the independent claims.
